

## Where the Black Swans Hide & The 10 Best Days Myth

Below we examine market outliers in financial markets. How much effect do these outliers have on long term performance? Can the investor prepare for these anomalies, or are they truly 'black swans' that cannot be managed? In this issue we examine numerous global financial markets on daily and monthly time frames. We find that these rare outliers have a massive impact on returns. However, these outliers tend to cluster and the majority of both good and bad outliers occur once markets have already been declining. We critique the "missing the 10-best-days" argument proffered by advocates of buy and hold investing, as we demonstrate that a significant majority of the 10 best days and the 10 worst days occur in declining markets. We continue to advocate that investors attempt to avoid declining markets where most of the volatility lies and conclude that market timing and risk management is indeed possible, and beneficial to the investor.

*Thanks goes out to Prabhat Dalmia for his assistance with this project.*

Nassim Taleb, author of *Fooled by Randomness* and *The Black Swan*, popularized the concept of the black swan – namely, the occurrence of utterly unforeseeable events that are thought of as not being possible based on previous experiences.

Taleb defines a black swan as:

- 1) Outlier outside the realm of regular expectations because nothing in the past can convincingly point to its occurrence.
- 2) The event carries an extreme impact.
- 3) Explanations for the occurrence can be found after the fact, giving the impression that it can be explainable and predictable.

Many market commentators have latched on to this term to describe all financial market events. However, the existence of large outlier events known as fat-tailed distributions in financial market returns has been well documented for over 40 years (Mandelbrot 1963, Fama 1965). While the financial media have only recently re-visited the fat-tail concept (due largely to the occurrence of the internet bust in 2000-2003 as well as the global financial meltdown in 2008 and 2009), it has been a thoroughly studied field in finance over the past several decades.

Investors should realize that normal market returns are extreme. Individuals that continue to believe in the Gaussian (bell-shaped) distribution, or ignore empirical results will continue to be surprised by future events. Roughly 40% of all yearly returns in US stocks are greater than 10% or less than -10%. Bear markets are common, and markets can and do decline from 50-100%.

Financial market return distributions are similar to fractal systems that follow a power law distribution (which is useful in describing events like earthquakes and volcanic eruptions). Below is a chart from the book *The Failure of Risk Management* by Hubbard that illustrates the inability of the Gaussian models to account for large outlier moves in financial markets. In a normal distribution world a 5% decline in the Dow in a single trading day should not have happened in the past 100 years. In reality, it has happened nearly 100 times.

Source: *The Failure of Risk Management*, Hubbard (2009)

Unfortunately, many investors have come to the conclusion that rare events are impossible to predict, and therefore, there is nothing to do other than buy and hold their investments and wait out any negative outliers. However, this explanation simply rids the investor (advisor) of any responsibility – the fatalistic attitude becomes "it was a black swan, it's not my fault!"

In this article we examine market outliers, their effect, but more importantly when they occur and if the investor can do anything to protect against them.

While we are not going to spend much time on a literature review, the appendix has a list of books and papers on market bubbles, financial market return distributions, and investment history. The next few issues of Cambria Quantitative Research are going to expand on some of the topics mentioned here (bubbles, forecasting, etc).

### MARKET OUTLIERS: THE 10 BEST DAYS MYTH

We first begin our examination by taking a look at market outliers in the US stock market back to 1928.

One of the most common rhetorical bulwarks in the defense of buy and hold is investing is to demonstrate the effects of missing the best 10 days in the market, and how that would affect the compounded return to investors. This is perhaps one of the most misleading statistics in our profession (another being the Brinson asset allocation study misquote). A number of academic papers have examined the effects of missing both the 10 best as well as the 10 worst days (Gire (2005) and Ahrens (2008) are two good ones).

Below we examine the S&P 500 (and the broad market predecessor) from 1928-2010. We use price history only as dividends will not have a meaningful impact on the daily return data.

**FIGURE 1**  
**US STOCKS DAILY RETURNS**  
**9/1928-2010, PRICE ONLY**

<b>S&amp;P 500</b>	<b>ALL</b>
<b>September 1928 - 2010</b>	
Number of Days	21729
Number of Years	86
Average Return	0.03%
Median Return	0.04%
Total Return	5869%
Annualized Return	4.86%
Annualized Volatility	18.34%

*Source: Global Financial Data*

What about the outlier returns? Below is a table for the best and worst 1% of all days, which equates to only about 2 or 3 days per year.

**FIGURE 2**  
**US STOCKS 1% BEST AND WORST DAYS**  
**9/1928-2010, PRICE ONLY**

	<b>WORST</b>	<b>BEST</b>
Number of 1% Days	217	217
Average Return	-4.85%	4.91%
Median Return	-4.27%	4.29%
Volatility	29.68%	30.41%
Max	-3.32%	16.60%
Min	-20.47%	3.27%

*Source: Global Financial Data*

Since 1928 one can expect these days to occur a handful of times every year. Much to the displeasure of the fear mongering media, -4% and +4% days are fairly regular.

To really examine the blackest of swans, below is the best and worst 0.1% of all days. They occur on average only once every few years.

**FIGURE 3**  
**US STOCKS 0.1% BEST AND WORST DAYS**  
**9/1928-2010, PRICE ONLY**

	<b>WORST</b>	<b>BEST</b>
Number of 0.1% Days	22	22
Average Return	-8.95%	9.45%
Median Return	-8.21%	8.65%
Annualized Volatility	45.48%	36.64%
Max	-6.85%	16.60%
Min	-20.47%	7.26%

*Source: Global Financial Data*

Days of -8% and +8% are fairly rare as are the -20% and +16% days. Exactly how big of an impact do these outliers have on performance? Massive. Below is a table that shows the annualized returns if the investor missed some of the best and worst days. If you missed the best 1% of all days your return gets crushed from 4.86% down to -7.08% per annum. However, the converse is true, if you

miss the worst 1% of returns your returns explode to 19.09% a year. And take special note that if you miss both the best and worst 1% of days your return is higher than buy and hold.

**FIGURE 3**  
**MISSING THE BEST AND WORST DAYS**  
**ANNUALIZED RETURNS 9/1928-2010, PRICE ONLY**

Miss Worst 0.1%	7.42%
Miss Best 0.1%	2.48%
Miss Both 0.1%	4.98%
Miss Worst 1%	19.09%
Miss Best 1%	-7.08%
Miss Both 1%	5.48%
All Days	4.86%

*Source: Global Financial Data*

Most analysts, unfortunately, stop here and throw up their hands. They proclaim buy and hold to be the only way to ensure being in the market for these best days. Because these events are so rare, and they have such a massive impact, there is infinitesimally small chance of predicting when they will occur and therefore the effort is useless. They take the ball all the way down to the five yard line but stop there.

What are they missing?

### THE HUMAN ELEMENT

Markets are a collection of humans, and being human, a collection of human emotions. Greed, fear, jealousy, pride, and envy all manifest themselves to the fullest in capital markets.

When you are making money you are thinking about the new car you are going to buy, how smart you are (and how much smarter you are than your neighbor), the vacation you are going to take, and the (2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup>) house you are going to buy. The part of the brain that is firing nonstop here is the same region that gets stimulated by cocaine or morphine.

However, when you are losing money you are probably not opening your account statements, you are thinking about how dumb you are (and how stupid you were to listen to your neighbor), how you are going to pay for that second house, and you likely feel significant revulsion to even thinking about investing. The brain processes portfolio losses in the same region that is stimulated by the flight response.

For a longer discussion on your behavioral biases check out the appendix as well as this great Andrew Lo video "[Technical Analysis: An Academic Perspective](#)". To demonstrate this effect Table 4 examines the returns, but more importantly the volatility when the market is appreciating versus declining (as defined as above or below the 200 days simple moving average).

**FIGURE 4**  
**MISSING THE BEST AND WORST DAYS**  
**9/1928-2010, PRICE ONLY**

	<b>WORST</b>	<b>BEST</b>
<b>Number of 1% Days</b>		
Advancing Market (> 200 SMA)	30.41%	21.66%
Declining Market (< 200 SMA)	69.59%	78.34%
<b>Number of 0.1% Days</b>		
Advancing Market (> 200 SMA)	36.36%	22.73%
Declining Market (< 200 SMA)	63.64%	77.27%

*Source: Global Financial Data*

What about the outliers -- where do they occur? The vast majority, roughly 60-80%, of the best and worst days occur after the market has already started declining. The simple reason is that markets are more volatile when they are declining, and when the really volatile events and days occur they tend to cluster together.

Our central argument is that returns improve and volatility is reduced when an investor is invested in uptrending markets thus avoiding the volatility and clustering of best and worst days inherent in declining markets. As you can see in Figure 5, in declining markets returns are much lower and volatility is much higher.

**FIGURE 5**  
**MISSING THE BEST AND WORST DAYS**  
**9/1928-2010, PRICE ONLY**

<b>S&amp;P 500 September 1928 - 2010</b>	<b>ALL</b>	<b>Decling Market (&lt; 200 SMA)</b>	<b>Advancing Market (&gt; 200 SMA)</b>
Number of Days	21,729	7,648	14,081
% of Time	100%	35.20%	64.80%
Average Return	0.03%	-0.01%	0.04%
Median Return	0.04%	0.00%	0.07%
Annualized Return	4.86%	-4.45%	10.29%
Annualized Volatility	18.34%	24.03%	14.32%

*Source: Global Financial Data*

Mandelbrot provides an insightful passage on volatility clustering and timing in his book *The Misbehavior of Markets*:

“What matters is the particular, not the average. Some of the most successful investors are those who did, in fact, get the timing right.”

This effect also plays out on the monthly timeframe as well. For a look at other markets including real estate, bonds, and foreign stocks on the monthly timeframe back to 1972 you can view a blog post here titled [“Your Irrational Brain”](#).

### EVIDENCE IN FOREIGN MARKETS

Any investment property or anomaly should be demonstrable in most if not all markets otherwise the results are likely from data mining and spurious. Estrada (2007) examined the evidence from 15 international markets and finds that “on average across all 15 markets, missing the 10 best days resulted in a portfolio 50.8% less valuable than a passive investment; and avoiding the 10 worst days resulted in a portfolio 150.4% more valuable than a passive investment.” He then goes on to the conclusion that, “given that 10 days represent less than 0.1% of the days considered in the average market, the odds against successful market timing are staggering.”

Below we recreate the prior tables with the Estrada dataset updated through 2010. We find similar statistics to the US data, namely, a small amount of outliers have a massive impact on performance and the best and worst outliers tend to cluster when the market is already declining. However, if you miss the best and worst days *in every case* your compound return is higher than buy and hold.

**FIGURE 5**  
**MISSING THE BEST AND WORST DAYS, VARIOUS DATES**

Country	# of Days	# of Years	Annualized Return	Miss 1% Best Days	Miss 1% Worst Days	Miss Both
Australia	13278	52	6.79%	-1.40%	17.56%	8.56%
Canada	8761	34	7.73%	-1.55%	20.46%	10.11%
France	10477	41	6.51%	-4.20%	19.79%	7.75%
Germany	12932	51	4.06%	-7.47%	17.90%	4.86%
Hong Kong	10110	40	12.61%	-6.80%	38.06%	14.28%
Italy	9766	38	5.28%	-6.41%	20.90%	7.50%
Japan	15296	60	5.52%	-5.27%	18.97%	6.82%
New Zealand	10158	40	4.90%	-2.86%	14.63%	6.16%
Singapore	10607	42	7.83%	-3.37%	21.33%	8.74%
Spain	9056	35	6.33%	-4.99%	19.97%	7.20%
Switzerland	10451	41	4.41%	-4.70%	16.32%	6.19%
Taiwan	12207	48	9.70%	-3.90%	26.87%	11.17%
Thailand	8800	34	7.78%	-7.63%	25.93%	7.93%
United Kingdom	10583	41	7.70%	-2.79%	19.94%	8.26%
United States	21530	85	4.63%	-7.36%	18.92%	5.30%

Source: Global Financial Data

The volatility clustering below the long term moving averages confirms the United States results, and on average 76% of the worst days and 67% of the best days occur after the market is already declining. Lengthy summaries on all of the foreign markets are in the appendix.

## CONCLUSIONS

For those investors pondering how they can attempt to avoid these highly volatile periods in markets, we invite you to download a few of our other white papers here: *"A Quantitative Approach To Tactical Asset Allocation"* and *"Relative Strength Strategies for Investing"*.

Astute market analysts must also realize the drawbacks and downsides of any indicator or investment approach. In the case of a trendfollowing approach there are two main drawbacks. First, in trendless markets whipsaws can occur that have negative effects on the portfolio. Second, and perhaps more important, a trendfollowing approach does not guarantee the investor from missing a black swan event in an uptrend. A very sharp move against the trend will not allow the investor or model time to react and protect against such a move. Investors looking for protection against this sort of event can use derivatives such as options to protect the portfolio when fully invested (so-called tail risk insurance), or consequently, to gain long exposure when mostly in cash and bonds (risk of missing out). This process could be a net cost (insurance) to the portfolio.

That is the point of risk management – understanding and trying to account for as many risks as you can.

### Summary:

1. The stock market historically has gone up about two-thirds of the time.
2. All of the stock market return occurs when the market is already uptrending.
3. The volatility is much higher when the market is declining.
4. Most of the best **and** worst days occur when the market is already declining. Reason: see #3. Markets are much riskier than models assuming normal distributions predict.
5. The reason markets are more volatile when declining is because investors use a different part of their brain making money than when losing money.

This publication has been prepared without taking into account your objectives, financial situation or needs. Before acting on this information, you should consider its appropriateness having regard to your objectives, financial situation or needs. CIMI is not responsible for any errors or omissions or for results obtained from the use of this information. Nothing contained in this material is intended to constitute legal, tax, securities, financial or investment advice, nor an opinion regarding the appropriateness of any investment. The general information contained in this material should not be acted upon without obtaining specific legal, tax or investment advice from a licensed professional. Past performance is not a guide to future performance, future returns are not guaranteed, and a loss of all of the original capital invested in a security discussed in this newsletter may occur. It is your responsibility to be aware of and observe the applicable laws and regulations of your country of residence.*

*There are inherent limitations in hypothetical*

*portfolio results as the securities are not actually purchased or sold. They may not reflect the impact, if any, that material economic and market factors might have had on the investment manager's decision-making if the hypothetical portfolios were real. Indices mentioned are used for comparison purposes, are related to the market in a broad sense and thus may differ from the model portfolios in their level of volatility. Indices are unmanaged and cannot be invested in directly. The back-tested data relates only to a hypothetical model of past performance of the GTAA strategy itself, and not to any asset management products based on this index. No allowance has been made for trading costs or management fees which would reduce investment performance. Actual results may differ. Returns represent back-tested performance based on rules used in the creation of the index, are not a guarantee of future performance and are not indicative of any specific investment.*
